

For the Period August 21 to 27, 2018

Producers took advantage of the warm and dry weather to make considerable harvest progress before light showers later in the week put field work on hold, according to Saskatchewan Agriculture's weekly Crop Report. Twenty-seven per cent of the crop is now in the bin, well ahead of the five-year (2013-2017) average of 13 per cent for this time of year. Seventeen per cent of the crop is now swathed or ready to straight-cut. Yields vary across the province, depending on the amount of moisture received over the growing season.

Harvest is most advanced in the southwestern region, where 46 per cent of the crop is now combined. The southeastern region has 42 per cent combined, the west-central region 23 per cent and the east-central region 16 per cent. Ten per cent of the crop is in the bin in the northeast and five per cent in the northwest.

Saskatchewan Harvest August 27, 2018 Per cent combined

Winter wheat	78
Fall rye*	96
Spring wheat	16
Durum	32
Oats**	19
Barley	16
Canaryseed	5
Flax	1
Canola	7
Mustard	30
Soybeans	5
Lentils	74
Peas	76
Chickpeas	12

*includes 23 per cent 'other'

**includes five per cent 'other'

Ninety-six per cent of the fall rye, 76 per cent of the field peas, 78 per cent of the winter wheat, 74 per cent of lentils, 30 per cent of the mustard, 36 per cent of the barley, 32 per cent of the durum, 16 per cent of the spring wheat and seven per cent of the canola are now in the bin. An additional 43 per cent of the canola and eight per cent of the mustard are swathed or ready to straight-cut.

There were some light showers throughout the province this week, with the highest rainfall (29mm) being reported in the Ponteix area. Topsoil moisture conditions remain unchanged, despite the limited extra moisture. Across the province, topsoil moisture conditions on cropland are rated as 25 per cent adequate, 46 per cent short and 29 per cent very short. Hay

One year ago

Twenty-six per cent of the 2017 crop had been combined and 24 per cent was swathed or ready to straight-cut. Warm and dry weather in most areas was causing topsoil moisture conditions to deteriorate.

* 'Other wheat' includes all wheat classes other than Hard Red Spring Wheat

** Crop yield predictions at this point in time. Please keep in mind these are regional averages, and yields can vary greatly across an area.

*** Canaryseed, mustard, lentil and chickpea in lbs./ac. All other crops in bu./ac.

Southeastern Saskatchewan:

- Crop District 1 – Carnduff, Estevan, Redvers, Moosomin and Kipling areas
- Crop District 2 – Weyburn, Milestone, Moose Jaw, Regina and Qu'Appelle areas
- Crop District 3ASE – Radville, Minton and Lake Alma areas

Harvest is progressing well in the region as producers now have 42 per cent of the crop in the bin, up from 24 per cent last week. This is well ahead of the five-year (2012-2016) average of 22 per cent for this time of year. An additional 28 per cent is swathed or ready to straight-cut.

Many areas reported small amounts of rain late this past week. The Carnduff area, which received the most, got 11 mm. The Lampman area maintains the record (402 mm) for the most rain in both the region and the province since April 1. The lack of moisture and warm temperatures early in the week have caused crops to ripen quickly, with many pastures and hay fields still in need of significant moisture.

Topsoil moisture conditions continue to deteriorate due to the warm and dry weather. Topsoil moisture on cropland is rated as 15 per cent adequate, 53 per cent short and 32 per cent very short. Hay land and pasture topsoil moisture is rated as seven per cent adequate, 39 per cent short and 54 per cent very short. Crop District 3ASE is reporting that 75 per cent of cropland, hay land and pasture remains very short of topsoil moisture at this time.

The majority of crop damage this past week is due to lack of moisture and strong winds. Reported yields vary greatly across the region, depending on the amount of moisture received over the past few months. Overall, yields range from average to well below average, although some pulses and cereals are yielding much higher than expected. There are some concerns over the lack of feed and fire risk.

Producers are busy combining, swathing canola and hauling bales.

Southwestern Saskatchewan:

- Crop District 3ASW – Coronach, Assiniboia and Ogema areas
- Crop District 3AN – Gravelbourg, Mossbank, Mortlach and Central Butte areas
- Crop District 3B – Kyle, Swift Current, Shaunavon and Ponteix areas
- Crop District 4 – Consul, Maple Creek and Leader areas

Harvest continues to progress quickly due to warm and dry weather earlier in the week. Producers have 46 per cent of the crop in the bin, up from 31 per cent last week and well ahead of the five-year (2013-2017) average of 24 per cent for this time of year. An additional 16 per cent is swathed or ready to straight-cut.

The majority of the region received some light rain late in the week. The Ponteix area received 29 mm, the most rain in the region. The Shaunavon area has received the most rainfall (209 mm) in the area since April 1. Many pastures and hay fields are still in need of significant moisture.

Topsoil moisture conditions improved slightly due to the light rain. Cropland topsoil moisture is rated as 11 per cent adequate, 45 per cent short and 44 per cent very short.

Hay land and pasture topsoil moisture conditions are rated as 11 per cent adequate, 33 percent short and 56 per cent very short.

Reported yields vary greatly across the region, depending on how much moisture has been received over the growing season. Overall, yields range from about average to well below average; however, some reporters have indicated that yields are much better than expected for crops such as pulses.

The majority of crop damage was due to lack of moisture, but strong winds also have caused some damage. Given the dry conditions, concerns remain about feed shortages and the risk of fire.

Producers are busy combining, swathing crops and clearing out bins.

East-Central Saskatchewan:

- Crop District 5 – Melville, Yorkton, Cupar, Kamsack, Foam Lake, Preeceville and Kelvington areas
- Crop District 6A – Lumsden, Craik, Watrous and Clavet areas

Sixteen per cent of the crop is now in the bin, up from seven per cent last week and well ahead of the five-year (2013-2017) average of six per cent for this time of year. An additional 35 per cent of the crop is swathed or ready to straight-cut.

Most areas in the region reported small amounts of rainfall on Monday, putting a pause on harvest operations. Craik received the most moisture in the region (18 mm). The Langenburg area has received the most precipitation (390 mm) in the region since April 1. The lack of moisture is drying crops down, and pastures and hay fields remain in need of rainfall to help them recover.

Topsoil moisture conditions have significantly worsened since last week. Topsoil moisture on cropland is rated as 17 per cent adequate, 49 per cent short and 34 per cent very short. Hay land and pasture topsoil moisture conditions are rated as 10 per cent adequate, 49 percent short and 41 per cent very short. Crop District 6A is reporting that 54 per cent of the cropland and 58 per cent of the hay land and pasture are very short of topsoil moisture at this time.

Reported yields range from below average to above average, depending on the moisture received throughout the growing season. Most crop damage this past week was due to wind and the lack of moisture.

Producers are busy combining, swathing canola and hauling bales.

West-Central Saskatchewan:

- Crop District 6B – Hanley, Outlook, Loreburn, Saskatoon and Arelee areas
- Crop District 7A – Rosetown, Kindersley, Eston and Major areas
- Crop District 7B – Kerrobert, Macklin, Wilkie and Biggar areas

Twenty-three per cent of the crop is now in the bin, up from 12 per cent last week and well ahead of the five-year (2013-2017) average of eight per cent for this time of year. An additional 30 per cent of the crop is swathed or ready to straight-cut.

The Conquest area received the most rain in the region this week (15 mm), while the rest of the region only got trace amounts. The Saskatoon area has received the most precipitation (319 mm) in the region since April 1. The prolonged lack of moisture has caused crops to ripen quickly and many pastures and hay fields are in need of significant rainfall to help them recover.

Topsoil moisture conditions continue to deteriorate in the region. Cropland topsoil moisture is rated as 13 per cent adequate, 60 per cent short and 27 per cent very short. Hay land and pasture topsoil moisture is rated as nine per cent adequate, 59 per cent short and 32 per cent very short. Crop District 7B is reporting that 86 per cent of the cropland and 87 per cent of the hay land and pasture are short or very short topsoil moisture at this time.

Reported yields vary greatly across the region, depending on how much moisture has been received over the growing season. Overall, yields range from about average to well below average. Most crop damage this past week was due to wind and a lack of moisture. Given the dry conditions, concerns remain about feed shortages and the risk of fire.

Producers are busy combining and swathing when the conditions are right.

Northeastern Saskatchewan:

- Crop District 8 – Hudson Bay, Tisdale, Melfort, Carrot River, Humboldt, Kinistino, Cudworth and Aberdeen areas
- Crop District 9AE – Prince Albert, Choiceland and Paddockwood areas

Harvest is underway in the northeast, much earlier than normal for many producers. Ten per cent of the crop is now combined, up from four cent last week and ahead of the five-year (2013-2017) average of three per cent for this time of year. An additional 35 per cent is swathed or ready to straight-cut.

Most areas in the region reported small amounts of rainfall later in the week, putting a pause on harvest operations. The Arborfield area received the most rain in the region this week (20mm); Arborfield also received the most precipitation (350 mm) in the region since April 1.

Cropland topsoil moisture is currently rated as three per cent surplus, 66 per cent adequate, 30 per cent short and one per cent very short. Hay land and pasture topsoil moisture is rated as 74 per cent adequate, 24 per cent short and two per cent very short.

Reported yields vary greatly across the region, depending on the amount of moisture received the past few months. There are a few reports of crops yielding much higher than expected, but most reported yields are about average. Crop damage this past week was mainly due to wind and a lack of moisture. Many fields have uneven growth, which makes swathing and desiccation timing difficult.

Producers are busy combining and swathing crops when conditions are favourable.

Northwestern Saskatchewan:

- Crop District 9AW – Shellbrook, North Battleford, Big River and Hafford areas
- Crop District 9B – Meadow Lake, Turtleford, Pierceland, Maidstone and Lloydminster areas

Harvest is now underway in the region and five percent of the crop is in the bin. This is up from one per cent last week and ahead of the five-year (2013-2017) average of three per cent for this time of year. An additional 26 per cent is swathed or ready to straight-cut.

Parts of the region received trace amounts of rain, up to 16 mm in the North Battleford area. The Frenchman Butte area has received the most precipitation (373 mm) in the region since April 1. Hay land and pastures in the region are in need of significant rainfall to help them recover from recent hot and dry weather.

Cropland topsoil moisture is rated as 70 per cent adequate, 21 per cent short and nine per cent very short. Hay land and pasture topsoil moisture is rated as 63 per cent adequate, 26 per cent short and eight per cent very short. Crop District 9AW is reporting that 20 per cent of the cropland and 24 per cent of the hay land and pasture are very short of topsoil moisture at this time.

Crop damage this past week is attributed to wind and lack of moisture. Producers are busy combining, desiccating fields and swathing crops.
