

# Industry Tip

## Use GPP Authorizations for Completions on New Licences

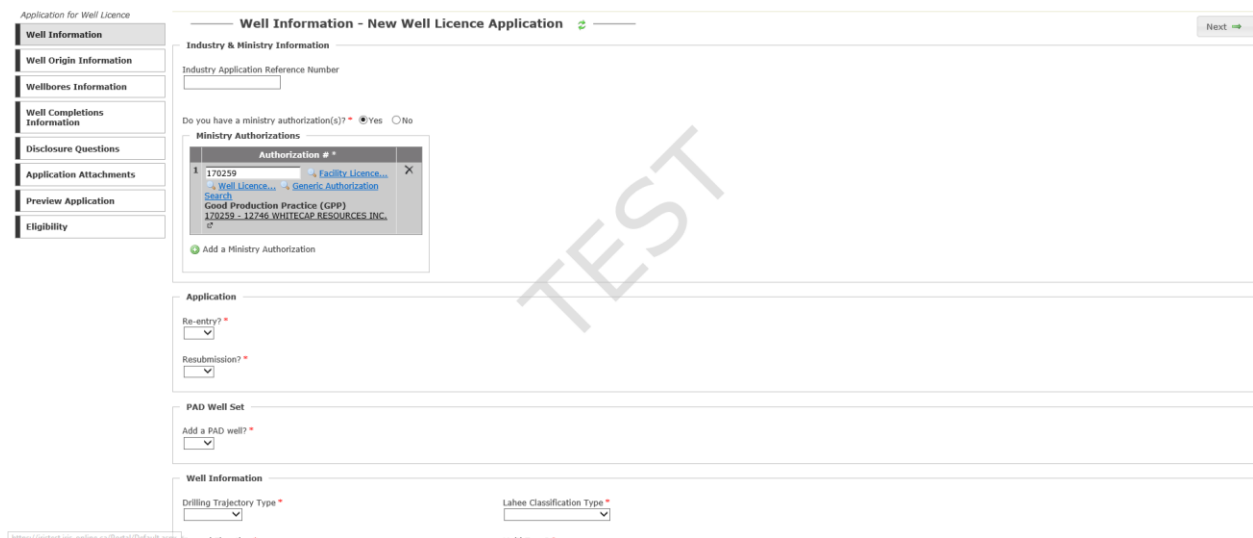

Date	Module/Application/Functionality	Notes
January 19, 2021	GPP Authorizations for Completions on New Licences	Well Infrastructure

### Background

This functionality will be used within the licence application process, whereby the applicant will be able to enter a Good Production Practice (GPP) authorization. When the authorization is entered on a licence application, the system will validate the authorization and assign GPP to the well completion created in IRIS after the well licence application has been approved.

### Process

Industry enters their GPP authorization in the well information tab of a well licence application. Users are able to enter more than one authorization in a well licence application. The licence application where the authorization should be entered is shown below.

IRIS will validate the GPP authorization used on a licence application against the completion details of that licence. If the authorization and licence application align as expected, the application process would proceed and GPP will be set on the Allowable Rate of Production (ARP) tab of the completion once

licence is issued. A GPP authorization can only be applied to gas and oil production completion types that are not subject to an off-target penalty., The licence will also validate against two associated entities from the authorization, pool and drainage unit/area (DU/DA) land. If the criteria are not met, the system would not accept the authorization and would stop the licence application from submission. The associate entity tab of GPP authorization and completion tab on a licence application are shown below.
