

Saskatchewan West Nile Virus Weekly Surveillance & Transmission Risk Report

FOR WEEK ENDING AUGUST 06 2022

Highlights:

Culex spp. mosquitoes increased in Estevan and Regina this week.

As of August 06, 2022, all *Culex* spp. mosquito pools have tested negative for West Nile virus.

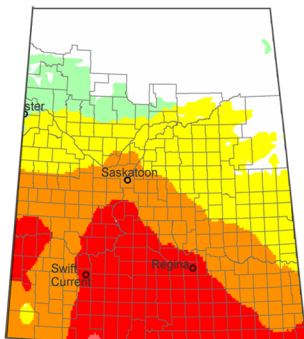

Historically, the last two weeks of July and the first two weeks of August are the highest risk for virus transmission.

To avoid mosquito bites, use repellents, cover up, and limit time outside during peak times of mosquito activity (between dusk and dawn).

Degree Day Accumulation (Base 14.3 to August 07, 2022):

Map courtesy of Agriculture and Agri-Food Canada

0 - 50	200 - 250	400 - 450	600 - 650
50 - 100	250 - 300	450 - 500	650 - 700
100 - 150	300 - 350	500 - 550	700 - 750
150 - 200	350 - 400	550 - 600	750 - 800

Southern, central and parts of western Saskatchewan have accumulated 350-400 degree days, which will increase *Culex tarsalis* biting activity and West Nile virus transmission where the virus is present.

Mosquito Surveillance Results

Average number of *Culex* spp. mosquitoes per trap night Positive Pools (%)

Saskatoon	<1	0
Regina	3	0
Estevan	10	0

Human Surveillance

THIS WEEK

0

WNV Positive Lab Tests

0

Cases of WNV Neuroinvasive Disease

0

Deaths due to WNV

THIS SEASON

0 positive lab tests*

0 Neuroinvasive cases

0 deaths due to WNV

*These include tests done by the Roy Romanow Provincial Laboratory (RRPL) and Canadian Blood Services (CBS). A positive laboratory test does not necessarily indicate a current WNV infection.
