

Saskatchewan West Nile Virus (WNV) Weekly Surveillance & Transmission Risk Report

FOR WEEK ENDING JUNE 29, 2024

Highlights:

Low numbers of *Culex* spp. mosquitoes were detected in ecoregion 3 this week.

The risk of WNV transmission has increased from minimal to low in ecoregion 3. The risk is minimal in other ecoregions but is expected to increase in the coming weeks.

All *Culex* spp. mosquito pools tested negative for WNV.

Mosquitoes are most active on warm evenings and between dusk and dawn. Take precautions to avoid mosquito bites.

Risk of being bitten by an infected mosquito this week by zone

Percentage of mosquito pools that tested positive for WNV this week and this season

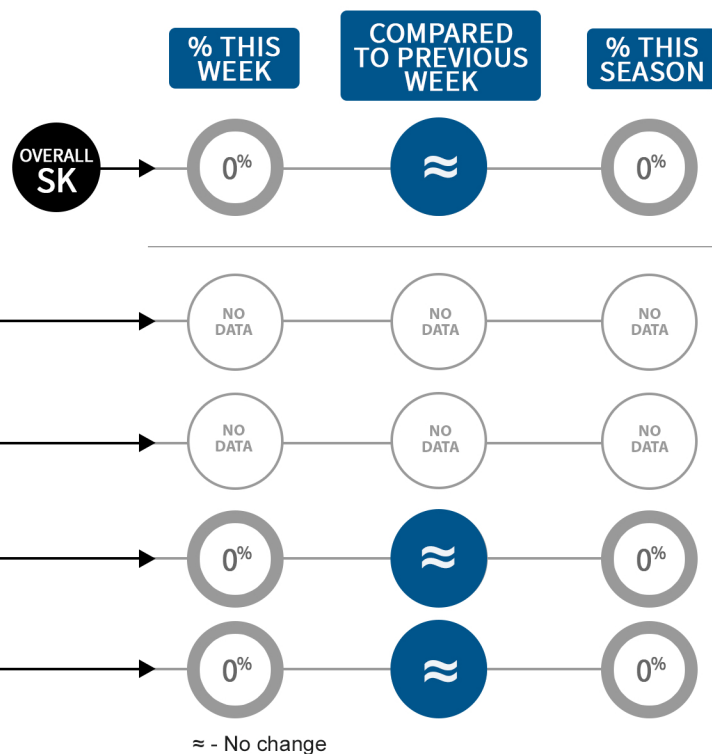

The risk of humans acquiring WNV infection depends on various factors including time of year, number and location of infected *Culex tarsalis* mosquitoes, and numbers of days with sufficient heat.

Risk level:

- Minimal
- Low
- Moderate
- High

Ecoregions 1 and 2 are not surveyed unless the risk of WNV increases significantly.

Human surveillance

THIS WEEK

0 WNV positive lab tests

0 cases of WNV neuroinvasive disease

0 deaths due to WNV

THIS SEASON

0 positive lab tests*

0 neuroinvasive cases

0 deaths due to WNV

*These include tests done by the Roy Romanow Provincial Laboratory (RRPL) and Canadian Blood Services (CBS). A positive laboratory test does not necessarily indicate a current WNV infection.
